News. Pharvaris announces positive topline data from CHAPTER-3 pivotal study of deucrictibant XR for prophylaxis of HAE attacks. Primary endpoint showed **83% attack rate reduction (ARR) versus PBO** (p<0.0001), **87% versus PBO in HAE Type 1/2**, with baseline attack rates at 3.76 vs 3.47/month. Protection was evident within the first week and sustained through week 24. Attack reduction response was unusually high (vs PBO, all secondary efficacy endpoints were statistically significant):

- ≥ 50% attack reduction 98.2% (40.0%)
- ≥ 70% attack reduction 96.4% (23.3%)
- ≥ 90% attack reduction 65.5% (10.0%)
- **45.5% were completely attack-free (AFR)** vs 3.3% on placebo

AE-QoL also improved substantially, with a -23.53 point placebo-adjusted difference at week 24 (p<0.0001).

Safety. Generally manageable, although TEAEs were higher on deucrictibant (76.4% vs 56.7%) and drug-related TEAEs were 20.0% vs 10.0%; there were 3 grade-3 and 1 grade-4 events, 1 SAE, but no treatment-related SAEs, and discontinuations were low (1.8% vs 3.3%). Management clarified that the single SAE/Grade 4 event was a laryngeal edema hospitalization in an HAE-nC1INH patient who had a very severe pre-study history. They also disclosed two liver-enzyme elevation cases (Grade 2) with potential confounders, one with long-term androgen use and one with fatty liver, which could lead to labeling language similar to other HAE prophylactic therapies (liver-test monitoring or normal-limit guidance).

Wolfe on Data. Our initial impression is that the magnitude and consistency of efficacy look very strong for an oral prophylactic. Results exceeded our expectations for success (~70%-80% ARR, initiation) and seems to be **on par with Takzyro** (87% ΔARR; 44% AFR) and **far better than oral Orladeyo** (44% ΔARR). The placebo-adjusted reduction is strongly supported by the responder distribution, where nearly every treated patient achieved ≥70% reduction and almost half were entirely attack-free. On HAE-nC1INH patients, efficacy signal was highly variable and based on only three treated patients, making it hard to comment on effects beyond Type 1/2. Management agrees that results should read through positively in Ph3 CREAATE for acquired C1-inhibitor deficiency due to clinical similarities to Type 1/2 HAE.

Wolfe on Stock. PHVS shares rose ~9% intraday as deucrictibant delivered lanadelumab-like efficacy in a once-daily oral tablet, a combination that could meaningfully reshape the HAE prophylaxis market. Data matches buyside bar for attack reduction (~80%-85%) but stock up on i) establishing IR on-demand + XR prophylaxis HAE franchise ii) Ph3 CREAATE readthrough iii) "oral efficacy = Takhzyro efficacy" market positioning. Management believe they could pull share from both underperforming Orladeyo patients and injection-averse TAKHZYRO patients, but

adoption will likely start with newly diagnosed patients. We expect the stock to sustain its strength today, and CHAPTER-4 safety data for NDA package.

Wolfe Research, LLC Fundamental Valuation Methodology:

Company:	Fundamental Valuation Methodology:
Pharvaris N.V.	**Biotech Valuation Methodology.** Our team uses a three-level approach when valuing & rating biotech stocks: fundamental, narrative, positioning. Please reach out for a fuller explanation of our methodology. **Fundamental.** Key inputs on this level are **catalysts**, **earnings**, and **valuation**. Biotech investors trade on peak revenue expectation on a vague and distant horizon. Even inaccurate models may not be proven wrong until many years in the future, esp pre-revenue biotechs. Therefore, to the extent that a stock is detached from earnings, we choose to (i) lean more on R&D catalysts (ii) adopt certain buyside assumptions if we see evidence of persistence. On mature biotechs, we value catalysts vs earnings based on narrative weight. We prioritize P/E and EV/peak sales over DCF because the former two methods appropriately include narrative and positioning. **Narrative**. Because biotech stocks often have limited anchor to earnings (even mature biotechs, to an extent), how the story is told has an outsized impact on how stocks trade. This includes how attractive the biotech sector is due to policies, foreign competition & M&A trends (i.e. sector-wide, **macronarrative**) and how individual

Company:	Fundamental Valuation Methodology:
	stocks behave based on both narrative weight & buyside expectation (i.e. company-specific, **micronarrative**).
	Positioning. Key inputs on this level are **fund flow** & **stock behavior.** We analyze systematics, factors, ownership, micropositioning, options pattern and short interest. We also regularly consult & quote macro experts on fund rotation. With many biotechs (more so at cash-burning ones), we consider positioning (sentiment) a core input into fundamentals, because sustained sentiment modifies a company's balance sheet health.
	Company-specific Valuation Methodology (PHVS) We use a multiples-based valuation method. In our model, we apply an EV/Peak sales multiple to deucrictibant. We assume net cash and use the diluted share count.

Wolfe Research, LLC Fundamental Recommendation, Rating and Target Price Risks:

Company:	Risks That May Impede Achievement of the Recommendation, Rating or Target Price:
Pharvaris N.V.	**Downside Risks:**

- **Clinical risks:** fails to produce successful clinical data
- **Regulatory risks**: Slowdown of FDA decisions and scheduling with biotech companies
- **M&A risk**: Reduced pharma appetite for M&A on small and midcap biotech companies. Increased pharma reliance on sourcing molecules from overseas (e.g. China)
- **Legal Risk**: Trump introducing 'most favored nation' to regulate drug pricing. Expansion of the IRA to increase price negotiation pressure on biologics. The government continuing fire people from the FDA or HHS.
- **Financial Risk**: Equity markets experience 'risk-off' sentiment. Funds may continue to rotate out of biotech, delaying multiples expansion and draining fundraising capabilities.
